Getting Started with DataView

Here are a few simple steps to get started integrating DataView into your project.

Once you've downloaded the DataView Demo and opened it in Xojo, copy the folder "DataView_Folder" and paste it into a new or existing project. DataView is a subclass of piDogScrollingCanvas. Both exist in the folder.

To change an existing listbox to a DataView, you will select the Listbox in the IDE and change the super to piDogDataView.DataView. Once completed, you should be able to see many options available in the inspector.

To add a DataView to a window, you can drag a DataView control, or one of the included subclasses from the Library pane of the IDE like any other control.

Take a look at the documentation included in the download for information about the various methods, events and properties available.
